ONTARIO WATER RESOURCES COMMISSION

OFFICE OF THE GENERAL MANAGER

Members of the Burlington Skyway Local Advisory Committee, Town of Burlington.

Gentlemen:

We are pleased to submit to you the 1966 Operating Summary for the Burlington Skyway Water Pollution Control Plant, OWRC Project No. 62-S-105.

It is hoped that our joint participation in efforts to combat water pollution will have even more success in the coming year.

Yours very truly

D. S. Caverly, General Manager.

W. S. MACDONNELL
COMMISSION SECRETARY

General Manager, Ontario Water Resources Commission.

Dear Sir:

I am happy to present you with the 1966 Operating Summary for the Burlington Skyway Water Pollution Control Plant, OWRC Project No. 62-S-105.

The report offers a concise summary of operating data for the year and comparisons with previous years where these are applicable and significant.

Yours very truly,

B. C. Palmer, P. Eng.,

Director,

Division of Plant Operations.

FOREWORD

● This operating summary contains complete information on the management of the project during 1966. It contains a concise review of the year's plant operation, significant financial details, and a visual presentation in graphs and charts of technical performance.

The information will be of value to interested parties in assessing the adequacy of the project at this time and its ability to meet future requirements.

The report is the result of co-operation by several groups within the Division of Plant Operations. These include the statistics section and the technical publications section. The Division of Finance and the draughting section of the Division of Sanitary Engineering were also closely associated with its publication.

The Regional Operations Engineer, however, has had the primary responsibility for the content, and will be happy to answer any questions regarding it.

366 REVIEW

A total of 1011.463 million gallons of sewage was treated during the year at an operating cost of \$59,744.34. The operating cost per million gallons was \$59.07 and the cost per pound of BOD removed was \$0.03.

The average daily flow during the year was 2.78 million gallons, representing 89 percent of the design capacity of the plant. Excellent BOD and suspended solids removals were effected by the plant, averaging 96.5 percent and 95.5 percent respectively. The OWRC objective of effluent BOD and suspended solids concentrations not exceeding 15 ppm was exceeded 6 percent and 42 percent of the time respectively.

During periods of high flow, the capacity of the gravity return activated sludge system was inadequate, resulting in some activated sludge being discharged with the final effluent.

Under the supervision of head office engineers, the plant staff has operated a clean, attractive and efficient plant for the Town of Burlington.

Process Data

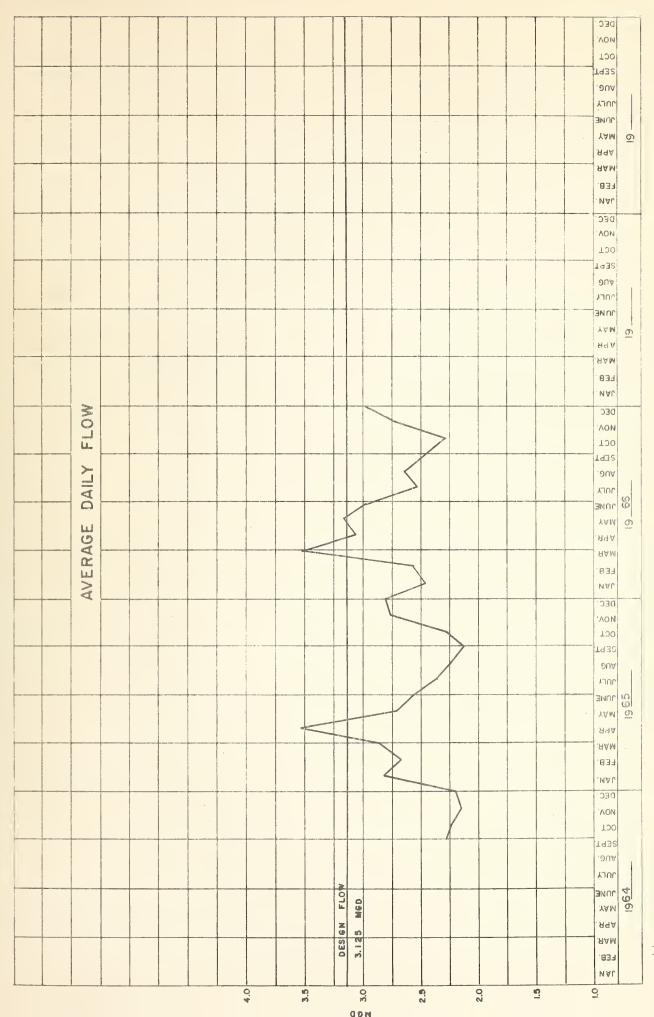

Average daily flows plotted on a probability basis and on an average per month basis can be found on the accompanying graphs.

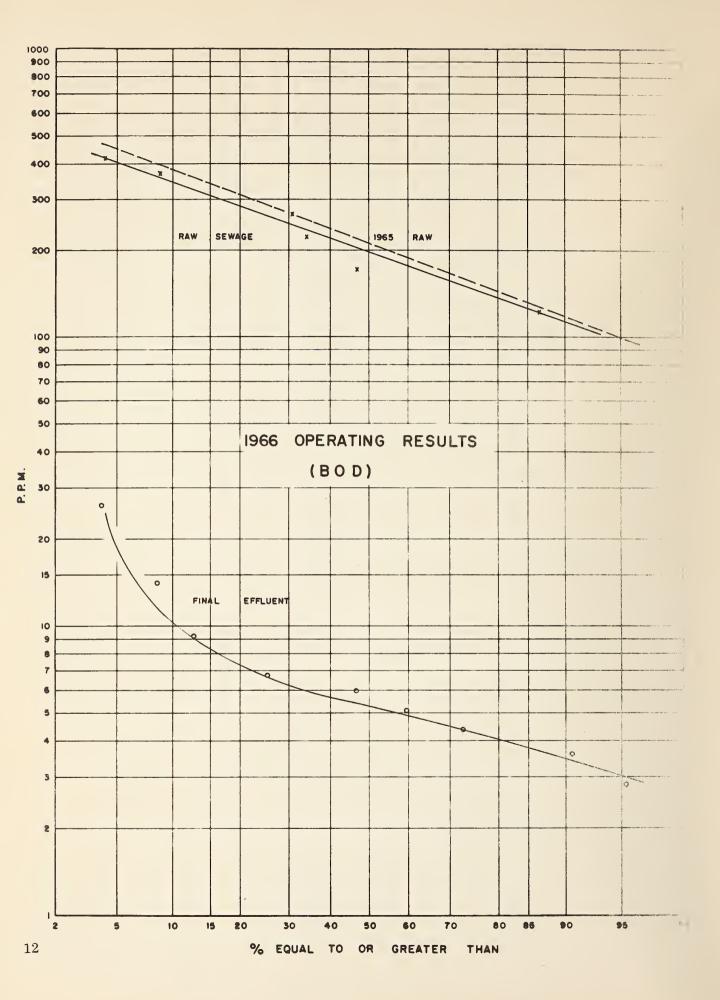

The average daily flow during the year was 2.78 million gallons. The maximum and minimum average daily flows, averaged on a monthly basis occurred in March and October and were 3.58 and 2.37 respectively. The design flow of 3.125 million gallons per day was exceeded 26 percent of the time.

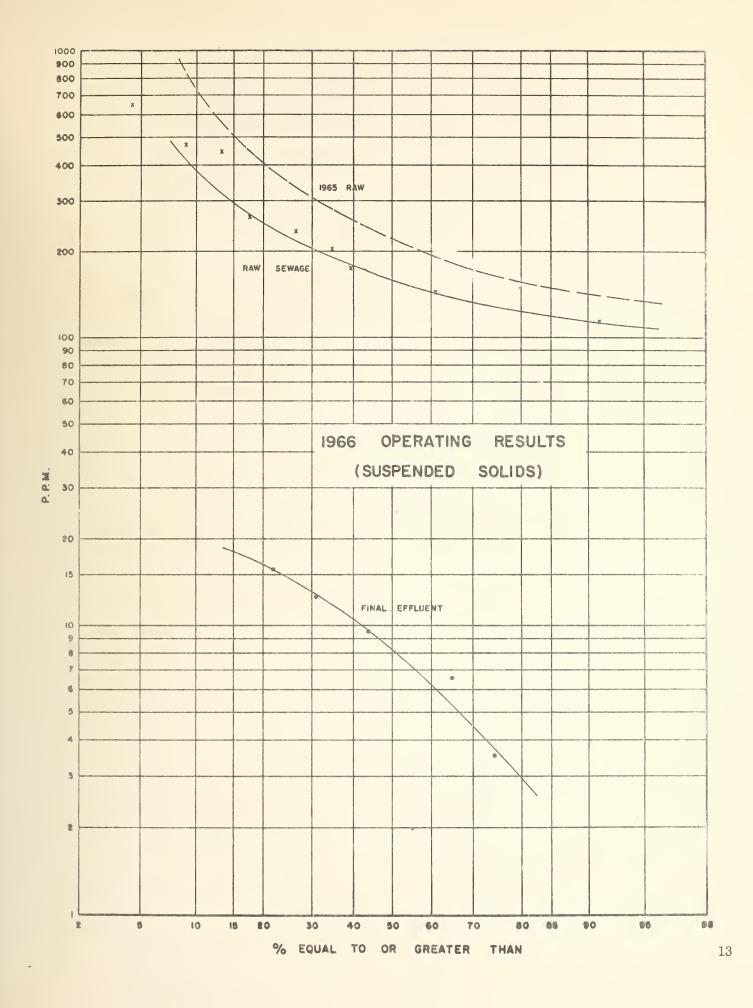

During the year a total of 1011. 463 million gallons of sewage composed of both domestic and industrial wastes received treatment.

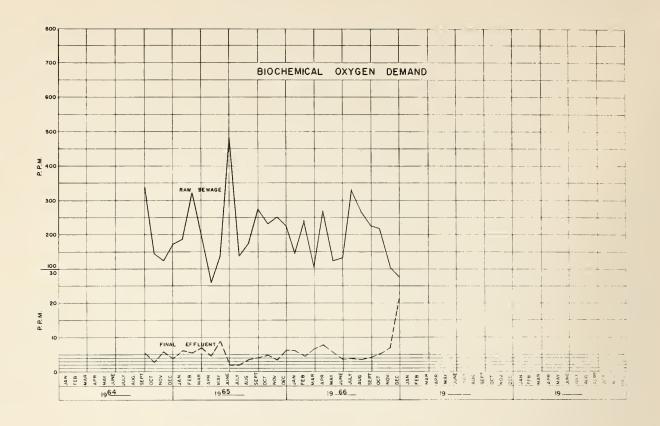

PERCENT OF THE FLOW IS EQUAL TO OR CREATER THAN

COMMENTS

Average suspended solids and BOD concentrations for both raw sewage and final effluent are plotted on a probability basis and on an average per month basis on the accompanying graphs.

The average raw sewage BOD and suspended solids concentrations were 186 ppm and 206 ppm respectively. The design raw sewage BOD and suspended solids concentration of 200 ppm were exceeded 52 percent and 32 percent of the time respectively. The plant afforded excellent treatment transferring to Hamilton Bay an effluent with an average BOD and suspended solids for the year of 6 ppm and 9 ppm respectively. The average BOD and suspended solids reduction efficiencies were 96.5 percent and 95.5 percent respectively.

A total of approximately 2893 cubic feet of grit was removed during the year.

^{* 17} days of chlorination.

COMMENTS

The final effluent was chlorinated for disinfection purposes between May 15 and October 15. An average dosage rate of 3.57 ppm was necessary to maintain a chlorine residual of not less than 0.5 ppm.

CONCLUSIONS

The average BOD and suspended solids removals were 96.5 percent and 95.5 percent respectively which indicates the plant afforded excellent efficiency in treating the sewage. Throughout the year the plant staff operated a clean, attractive and efficient plant for the Town of Burlington.

RECOMMENDATIONS

The flows received at this plant are approaching the design value of 3. 125 mgd, averaging 2.78 mgd. Consideration should be given to expansion of plant facilities, particularly the return activated sludge system.
